CS436/536 Final Project Report Requirements

1. Report should be written in IEEE paper format including: title, abstract, introduction, background, methodology, your contribution, experimental setup, results, discussion and reference. IEEE paper templates are available from this link. Submission in a single PDF file.
2. Report should be 4 Pages long. This includes everything (references, appendix) but excludes any code or portion of the code.
3. Include at least one graph or table to show the performance of your modified model compared to the original model. This performance can be accuracy, total time consuming for a test, computational complexity analysis, etc. Please use the same machine, same environment and same test data set to obtain performance metric values.
4. Original model source code link and your GitHub source code repository link must be included in the report. Fork the original code repository (if possible), or upload the original code as the base code of your project. If you work as a team, all teammates are supposed to contribute to this project. We will use git log to check everyone's commits. Update README file in the repository including teammates' GitHub account name, brief description of the contribution for each member and highlighting any important change. If you are not familiar with GitHub, please refer to this guide.
5. Copying fragments from the original paper is forbidden. In particular, you must paraphrase the key technique and write in your own words in the methodological section. In-text citations are allowed, but appropriate bibliography should be added in the reference section
6. **Due date is December 5. No overdue submissions will be accepted. You will receive a zero if you do not have any submission.**
